

“Tap Into” Your Tap Water

tap into
Quality . Reliability . Value

The availability of clean, safe, healthy drinking water is something most of us take for granted. The water that flows from your tap is more than just a convenience, it contributes to quality of life. A well maintained water system is critical to public health and fire protection, and comes at a value that can't be beat when compared to bottled water.

Tap Into...Quality

Up to 100 tests a day are performed on the drinking water you receive at your business or home, ensuring that your water meets or exceeds every health and safety standard set by state and federal regulations.

Tap Into...Reliability

In a world where more than 3.4 million people die each year from preventable waterborne disease, our safe and reliable water systems assure we can drink from virtually any public tap with a guarantee of safety and reliability.

Reliability also relates to accessible fire flow. One of the primary purposes of water systems is the suppression of fire. Before water systems were constructed, catastrophic fires were a constant threat in our cities. To protect against fire, water systems must be maintained with vigilance to assure necessary pressure and availability.

Tap Into...Value

Through a vast system of aqueducts and pipeline, water is imported into our region from up to 600 miles away. Despite the rising costs of transportation and treatment, and the cost of developing new supplies, the cost of tap water remains a remarkable value—allowing you to fill more than five one-gallon containers with quality tap water for less than a penny?
